WASHINGTON 25, D. C.

PREFACE

Format

The Current List of Medical Literature is a monthly publication of the Armed Forces Medical Library. The last (June or December) number of each semi-annual volume is a cumulation of the author and subject indexes of the preceding five numbers. Each regular number consists of three parts: a Register of Articles, a Subject Index, and an Author Index.

Register of Articles. The Register is arranged alphabetically by journal title, the articles listed and numbered according to their appearance in the journal itself. The numbering of articles is begun anew with each volume of the Current List and continues through the five Registers of that volume.

The full title of each journal appears in upper case as a caption, followed in parentheses and lower case by the location of the editorial office or place of publication, if this is not contained in the title of the journal itself. For example, GLASGOW MEDICAL JOURNAL and WIENER MEDIZINISCHE WOCHENSCHRIFT supply in their titles the geographic information given in parentheses after ACTA HAEMATOLOGICA (Basel) and JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION (Chicago). Directly under the title caption appears a reference line, which consists of the title abbreviation, volume and issue number, and the date of the publication of the particular journal piece. Both volume and issue numbers are given in arabic numerals, 23(2), for example, indicating Volume 23, Number 2. This form is used for the first time in this volume of the Current List (Volume 27, January-June 1955) replacing the colon form, 23:2, heretofore used. If more than one issue of a title appears in a particular number of the Current List, as is commonly the case with weeklies, the reference line, but not the full title caption, appears before each of the separate issue listings.

Below the reference line are listed the articles in order of their appearance in the journal. All original articles are listed with no attempt at a critical selection. Occasionally, however, an article is omitted from the listing and is not indexed if it falls beyond the scope of the Armed Forces Medical Library, and therefore, of this publication. Omission of such articles is indicated by an asterisk prefixed to the reference line of the journal issue.

In addition to substantive articles the following types of communications are also indexed: biographical material (including significant obituaries) of more than a column or page length; proceedings of clinicopathological conferences; reports of scientific material presented at congresses or conferences; editorials and other communications of column or page length on a scientific theme; and reports of the Councils of the American Medical Association. Reprints, abstracts, book reviews and notices of an organizational nature are not indexed.

Each article entry is composed of a serial number relating it to the indexes, the author or authors of the article (surname followed by initials, all in upper case), the title of the article with an English translation where necessary, and the pagination. Cyrillic alphabets are transliterated according to the rules of the Library of Congress.

The Current List also indexes medical project reports. These are, in most instances, near-print reports of research projects accomplished under government contract and issued by the sponsoring agency or institution. These reports are listed alphabetically by sponsor in an appendix to the Register, and are indexed by author and subject in the same fashion as other articles.

Subject Index. The alphabetical subject index provides three levels of subject breakdown: a main heading, a subheading, and a sub-subheading, hereafter called the "modification". Main headings are those which appear in the Subject Heading Authority List used by the Current List Division, Armed Forces Medical Library.* Subheadings are standard words or phrases representing concepts of frequent occurrence in biomedical literature and useful for purposes of subgrouping. Most of the subheadings are applicable to a single category of main headings, such as diseases, anatomical parts, or chemical substances, while others are applicable to more than one such category. The modification is derived from the article itself and attempts to give within its limits an indication of the substance of the article. Where large amounts of material under a particular main heading or subheading justify further grouping, certain obvious rules of syntax are observed in the formulation of modifications.

Beginning with the January 1955 issue of the Current List, the asterisk preceding the subject index entries will no longer be used to denote the

fact that the reference is to a foreign language article. Replacing this system is the use of a symbol in parentheses after the modification to indicate the specific language of the article to which reference is made. When the article does not require modification of the main heading or subheading, the language symbol stands alone; absence of such a symbol indicates that the article is in English. The symbols used are as follows:

Af	Afrikaans	Jap	Japanese
Bul	Bulgarian	Nor	Norwegian
Ch	Chinese	Pol	Polish
Cz	Czech	Por	Portuguese
Dan	Danish	Rum	Rumanian
Dut	Dutch	Rus	Russian
Fin	Finnish	Ser	Serbo-Croatian
Fr	French	Sl	Slovene
Ger	German	Sp	Spanish
Gr	Greek	Sw	Swedish
Heb	Hebrew	Tur	Turkish
Hun	Hungarian	Uk	Ukrainian
It	Italian		

Author Index. Every author credited by an article is listed in the Author Index by surname and initials. Articles about an individual, including obituaries, are listed in the Subject Index under the headings BIOGRAPHIES and OBITUARIES, with the name of the individual as the modification.

Subject Indexing Policy

Subject Headings. In general the words or phrases used for subject headings are those in common usage; wherever practicable, they agree with terminology employed by authorities in the various subject fields. Most subject headings conform to one of three general types: those defining unitary concepts, as the names of specific diseases (TUBERCULOSIS), organs (KIDNEYS), and chemical substances (LYSINE); those defining manifold concepts, as the names of organ-localized disease processes (TUBERCULOSIS PULMONARY), physiological phenomena (BLOOD COAGULATION), surgical procedures (TEETH EXTRACTION); and those defining generic entities consisting of several related concepts (LIPOIDOSIS, RODENTS, ANTIHISTAMINICS). This last type is especially to be noted; it is used in the belief that it meets many user requirements in the most satisfactory way possible. No limitation is placed upon the number of subject headings which may be utilized in indexing a single article. For example, the article whose subject is chloramphenicol therapy of typhoid osteomyelitis of the femur will be entered under CHLORAMPHENICOL, TYPHOID FEVER, OSTEOMYELITIS and FEMUR.

In certain areas, subject headings differ from those of traditional usage. The policies underlying subject heading selection in these areas are outlined below.

Arteries and Veins. The major vascular trunks are represented by inverted headings which follow the headings ARTERIES and VEINS. The lesser vasculature is indexed under the name of the organ or system supplied and the subheading blood supply. For example, material on the retinal artery is indexed under RETINA, blood supply.

Bacteria and Parasites. The terminologies are those of Bergey's Manual of Determinative Bacteriology (1948) and Craig and Faust's Clinical Parasitology (1951). All bacterial genera recognized by Bergey appear as main headings, as do certain specific names of medical importance. The more important parasitic genera appear as main headings, while the less important are referred to familial terms. The subheading infections may be used under both bacterial and parasitic genera to indicate infections for which a more specific name either does not exist or is not used (as PASTEURELLA, infections). If the amount of material in such instances has been found to be large, the word "infections" may be incorporated with the generic term as part of the main subject heading (as SALMONELLA INFECTIONS).

Chemicals and Drugs. A middle ground has been sought between detailed structural subject headings and oversimplified ones. In general, heavy reliance is placed upon terms which describe the common function, action or use of a group of substances, as PARASYMPATHOLYTICS, MUSCLE RELAXANTS, ANTIHISTAMINICS, CONTRAST MEDIA. Generic terms approved by the Council on Pharmacy and Chemistry of the American Medical Association are used throughout; only in rare instances are proprietary names used as headings.

Enzymes. Subject headings of enzymes are in most cases group designations adopted from a classification compiled by the Chemical-Biological Coordination Center, National Research Council. Occasionally, the names of particular members of such systems are also used as subject headings. An extensive cross reference structure is provided.

Muscles. Indexing is for the most part by anatomical area or region by using the subheading muscles under the main headings ARM, BACK, BUTTOCKS, FINGERS, FOOT, FOREARM, HAND, HEAD, LEG, NECK, PELVIS, PERINEUM, SHOULDER, THIGH, THORAX, THUMB. The main heading MUSCLES appears for muscle as tissue, and it has been found expedient to include the following

five inverted headings which follow MUSCLES, as well as the term DIAPHRAGM: MUSCLES, MASTICATORY; MUSCLES, OCULOMOTOR; MUSCLES, PECTORALIS; MUSCLES, PSOAS; MUSCLES, SCALENUS.

Neoplasms. The problem of tumor nomenclature has been resolved by using as main headings in most cases the terms preferred by the American Cancer Society's Manual of Tumor Nomenclature and Coding (1951). Particular neoplasms whose histology is closely related to, or inseparable from, an anatomical site have been referred to that subject heading and the subheading neoplasms. Thus, HIDRADENOMA is referred to SWEAT GLANDS, neoplasms. Cross-references are liberally provided and should obviate any great difficulty.

Nerves. The major nerve trunks are represented by inverted headings such as NERVES, OLFACTORY. Material on the lesser innervation is referred to organ or anatomical site and the subheading innervation. The nervous systems are headed directly as NERVOUS SYSTEM, CENTRAL NERVOUS SYSTEM. as are the various parts of these systems, as BRAIN, SPINAL CORD, CEREBRAL CORTEX.

Specialties. Subject headings for the medical and other scientific specialties are used, but are, in the Current List, reserved for their professional aspects in contradistinction to their subject elements. Where necessary, separate headings have been devised to clarify this differentiation, as NURSING CARE and NURSING PROFESSION; SURGERY and SURGERY, OPERATIVE.

Surgical procedures. In general the names of specific surgical operations are used as subject headings only rarely, the procedures being referred instead to an anatomical part, as HYSTERECTOMY see UTERUS, surgery (particularly when the term for the surgical operation incorporates the root of the word for the anatomical site). Exceptions to this general rule are SYMPATHECTOMY, COLOSTOMY, TEETH EXTRACTION and CATARACT EXTRACTION. The terms EPISIOTOMY, AMPUTATION, FENESTRATION, and CIRCUMCISION are also used.

Currency

Currency is a prime objective of this index, and every effort consistent with production schedules is made to maintain currency. Journal publication dates should be examined carefully. It is not uncommon for actual publication to lag months, and sometimes more than a year, behind the date of publication given on the issue. The receipt of foreign journals particularly is often delayed. More recent issues sometimes are received before those published earlier. Though journals are commonly indexed and published in chronological order, delay in receipt will postpone publication of later material only for a reasonable time. In such instances the Register of Articles carries notation of a gap in chronological sequence.

Users of the index are earnestly invited to share in the work by submitting all pertinent comments and suggestions to the Editor.
